

Q.1) A server's purpose is to store files and messages to users and devices. A server also makes sure files go to the person or device they are intended for.

Q.2) A wireless access point (WAP).

Q.3) When two networks are joined together using a router, they sometimes use different ways to send data. A modem converts the data sent by one network into a form that can be understood by the second network.

Q.4) A switch is more secure and works faster than a hub.
