

Finding ΔH (energy change) practically.

Combustion

Displacement

Neutralization

Finding ΔH combustion

$$\rightarrow Q = mc\Delta t \Rightarrow \Delta t = \frac{Q}{mc}$$

$$\begin{aligned} \text{Energy transfer} &= 100 \times 4.2 \times 10 \\ &= 4200\text{J} \approx 4.2 \text{ kJ} \end{aligned}$$

$m_1 = 200\text{g}$
 $m_2 = 199\text{g}$

$$4.2 \text{ kJ} \xrightarrow[\text{from}]{\text{produced}} 2\text{g C}_2\text{H}_5\text{OH}$$

$$\Delta H = \frac{96.6 \text{ kJ}}{1 \text{ mol}} = 96.6 \text{ kJ/mol} = 46\text{g C}_2\text{H}_5\text{OH}$$

$$\Delta H = -96.6 \text{ kJ/mol}$$

- * Two fuels A and B, plan an experiment to show which one produce more energy?
 - Take a known mass of water with known initial temp. in a copper can.
 - " " " " " Fuel A
 - Ignite the fuel, and record final mass and final temp. of water.
 - Repeat exp. using fuel B.
- Conclusion: The fuel which cause more temp. rise per gram of fuel, produce more energy.

$$\begin{array}{l} \uparrow Q \quad \Delta t \uparrow \\ \uparrow m \quad \Delta t \downarrow \end{array}$$
